TITLE: Shell extensions for an
operating system

---------- KWIC ---------

Abstract Text - ABTX (1):
   An operating system provides extensions through
which application developers
may extend the capabilities of a shell of the
operating system. For example,
application developers may add **menu** items to **context**
menus for objects that are
visible within an **integrated** system name space. In
addition, developers may
add property sheet pages for such objects.
Application developers also have
the option of providing per-instance icons for each
instance of an object.
Application developers may provide data object
extension handlers for
customizing data sources on a per-object class basis
and may provide drop
target extension handlers on a per-object class
basis to customize drop target
behavior. Developers may additionally provide
copy-hook handlers to regulate
file system operations on objects. Developers may
also extend the
functionality provided by the shell of the operating
system by adding their own
custom name spaces to the integrated system name
space. The mechanism provided
